

Specification

This application is a national phase of
PCT/JP2004/009128 that claims priority from Japanese
5 patent application No. 2003-201079 filed July 24, 2003
and Japanese patent application no. 2003-338446 filed
September 9, 2003.

10 Illumination optical equipment, exposure equipment and
exposure method

Technical field

[0001] The present invention relates to illumination
optical equipment, exposure equipment and an exposure
method, and in particular relates to exposure equipment
15 for manufacturing microdevices such as semiconductor
elements, image pickup elements, liquid crystal display
elements or thin film magnetic heads in a lithographic
step.

Background art

20 [0002] In typical exposure equipment of this type, the
optical flux that is emitted from the light source forms
a secondary light source constituting a substantially
planar light source comprising a large number of light
sources, that are integrated by means of an optical
25 integrator constituted by a fly-eye lens. The optical
flux from this secondary light source is restricted by
means of an aperture stop that is arranged in the
vicinity of the downstream side focal plane of the fly-
eye lens, before being input to a condenser lens.

30 [0003] The optical flux that is focussed by this
condenser lens illuminates in superimposed fashion a mask
that is formed with a prescribed pattern. After passing
through the pattern of the mask, the light is imaged on a
wafer, by means of a projection optical system. In this

way, the mask pattern is exposed by projection (i.e. transferred) onto the wafer. It should be noted that the pattern that is formed on the mask has a high density of integration and so it is indispensable to obtain a
5 uniform illumination distribution on the wafer in order to accurately transfer this fine pattern onto the wafer.
